

## AI-Powered Lead Qualification & CRM Automation with Make.com

### 1. Workflow Overview

This Make.com scenario automates the process of receiving, analyzing, qualifying, and routing leads. A new lead response is received through Google Forms and stored in Google Sheets. The scenario watches the response sheet and processes each new lead automatically.

The lead information includes:

- Name
- Email
- Company
- Job Title
- Budget
- Message

The lead information is then sent to Groq AI for qualification.

### 2. AI Lead Qualification

The Groq AI module analyzes the lead information and generates:

- Summary of the inquiry
- Lead Intent
- Lead Score from 1–10
- Recommended Action
- Lead Category

The scoring rules are:

- **8–10 = High**
- **5–7 = Medium**
- **1–4 = Low**

The AI considers the overall quality of the lead, including business need, buying intent, job role, company, budget, urgency, and readiness.

### 3. JSON Parse

After receiving the AI response, the JSON Parse module converts the AI-generated JSON response into structured fields.

These fields are then available for the next modules:

- Summary
- Intent
- Lead Score
- Recommended Action
- Category

### 4. Google Sheets Master Log

Every processed lead is saved in the **Lead** Google Sheet.

This ensures that all leads are logged regardless of whether they are High, Medium, or Low quality. The master sheet stores the original lead information together with the AI qualification results.

### 5. Router and Filters

A Router is used to divide leads into three different paths based on the Lead Score.

#### **High-Quality Lead**

**Filter:** Lead Score  $\geq 8$

High-quality leads are sent through Gmail notification.

The email contains important lead details such as the name, email, company, budget, summary, intent, lead score, and recommended action.

#### **Medium-Quality Lead**

**Filter:** Lead Score  $\geq 5$  AND Lead Score  $\leq 7$

Medium-quality leads are stored in the **Medium** Google Sheet for further follow-up.

#### **Low-Quality Lead**

**Filter:** Lead Score  $< 5$

Low-quality leads are stored separately in the **Low** Google Sheet as an archive.

### 6. Error Handling

An error-handling route is configured for the Groq AI module.

If the AI request fails, the scenario records the failed lead in the **Error** Google Sheet with:

- Timestamp
- Name
- Email
- Message
- Status
- Error message

This helps track AI failures without losing the lead information.

### 7. Result

The automation reduces manual lead qualification work by automatically analyzing every lead, assigning a score, routing the lead to the appropriate path, and storing the result in Google Sheets. The workflow provides a complete automated lead qualification and CRM logging process using Make.com, Groq AI, Gmail, and Google Sheets.
